Abstract— Materials constitute a major cost component for any Industry. The total cost of installed material may be 50% or more of the total cost. Materials represent a major expense in construction, so minimizing procurement cost improves opportunities for reducing the overall project cost. Inventory control technique minimize the wastage of material & reduce the cost of project. Construction material constitutes a major cost component in any construction project. ABC analysis is effective technique in material management. ABC analysis minimize the wastage of material and save the time of project.

Index Terms- Inventory management, Inventory control, Cost reduction

I. INTRODUCTION

Materials constitute a major cost component for any Industry. The total cost of installed material may be 50% or more of the total cost. “Material management is defined as the process to provide right material at right place at right time in right quantity so as to minimize the cost of project”. Inventory management deals with the determination of optimal policies and procedures for procurement of commodities. Since it is quite difficult to imagine a real work situation in which the required material will be made available at the point of use instantaneously, hence maintaining, inventories becomes almost necessary. The concept of inventory management has been one of the many analytical aspects of management. It involves optimization of resources available for holding stock of various materials. Inventory management is simply the process by which an organization is supplied with the goods and services that it needs to achieve its objectives of buying, storage and movement of materials. The efficient management of materials plays a key role in the successful completion of a project. The control of materials is a very important and vital subject for every company and should be handled effectively for the successful completion of a project. The responsibility of material management department for the flow of material from the time the material is ordered, received, and stored until they are used is the basic responsibility of material management. Materials represent a major expense in construction, so minimizing procurement cost improves opportunities for reducing the overall project cost.

II. LITERATURE REVIEW

Ashwini R. Patil (2013) Suggested that the total cost of material may be 50% of total cost; so that it is important for contractor to consider that timely availability of material. Material Manager should maintain reports such as material to order between two dates, material assignments, waste control, when to purchase construction material, when material must be on site, and purchase order between two dates. The responsibility of Material management department for the flow of material from the time the material is ordered, received, and stored until they are used is the basic responsibility of material management. Materials represent a major expense in construction, so minimizing procurement cost improves opportunities for reducing the overall project cost. [1]

T. PhaniMadhavi (2013) Suggested that, management system that is required in planning and controlling the quality & quantity of the material, punctual equipment placement, good price and the right quantity as required. materials management can be defined as a process of planning, executing, and controlling the right source of materials with the exact quality, at the right time and place suitable for minimum cost construction process. Capability to coordinate and integrate purchasing, shipping and material control from suppliers is required for material cost control. [2]

Aditya Pande, S. Sabihuddin Suggested that materials management has become a critical component of successful project execution. Moving away from a sheer tactical role, it has earned strategic value, and organizations have become conscious of the many benefits that effective material management practices can drive, including reduced costs, higher productivity, warranted quality, increased reliability, and added the development that is going in the material management on fast track construction. this literature review will help to improve different material management for successful implementation and completion construction project sites. [3]
III. INVENTORY CONTROL TECHNIQUE

Inventory Control is defined as the supervision of supply, storage and accessibility of items in order to ensure an adequate supply without excessive oversupply.

The following are the important tools and technique of inventory management and control.

A. A.B.C. Analysis
B. EOQ Analysis

A. ABC ANALYSIS

The ABC inventory control technique is based on the principle that a small portion of the items may typically represent the bulk of money value of the total inventory in construction process, while a relatively large number of items may form a small part of the money value of stores. It is also known as Selective Inventory Control Method (SIM).

The items ABC analysis is a method for dividing on-hand inventory into three classifications A, B, C based on annual consumption unit.

- “A” items : money value is highest 70%, represent only 10% of items
- “B” items : money value is medium 20%, represent about 20% of items
- “C” items : money value is lowest 10%, represent about 70% of items

B. ECONOMIC ORDER QUANTITY

The EOQ refers to the order size that will result in the lowest total of ordering and carrying costs for an item of inventory. If a firm place unnecessary orders it will incur unneeded order costs. If a firm places too few order, it must maintain large stocks of goods and will have excessive carrying cost. EOQ or Fixed Order Quantity system is the technique of ordering materials whenever stock reaches the reorder point. Economic order quality deals when the cost of procurement and handling of inventory are at optimum level and total cost is minimum. In this technique, the order quantity is larger than a single period’s need requirement so that ordering costs & holding costs balance out.

IV. DETAILS OF CASE STUDY

For the study of, a construction site of “Kiran Sankalp, Pune” which is a reputed construction company in Pune, carrying out various on-going projects in considered. “Kiran Sankalp” IS one of their projects which have great location chosen for this case study. In this work the method of inventory control technique i.e. ABC analysis used.

Name of site - Kiran Sankalp
Site location- Kiran Sankalp building, Susgaon, Pasan road, Pune.
Building for case study- Kiran Sankalp Residential parking building, Susgaon, Pune.

1. ABC ANALYSIS CALCULATIONS FOR KIRAN SANKALP BUILDING, PUNE

ABC analysis is a basic analytical management tool. This technique, popularly known as “Always Better Control” for the alphabetical approach. This approach helps the material manager to exercise selective control and focus only on a few items.

IV. Conclusion
To minimize the construction cost and duration at each phase is important. It is a need to meet the present day requirements and to complete the project within the estimated time, cost, and available resources. Materials management has become a critical component of successful project execution. Inventory control technique minimize the wastage of material & reduce the cost of project. Construction material constitutes a major cost component in any construction project. The total cost of material may be 50% of total cost; so that it is important for contractor to consider that timely availability of material is potential cause of successful completion of project.

V. ACKNOWLEDGMENT
I express my profound gratitude to my project guide Prof. Mr. Manish Mata for his invaluable guidance, encouragement and supervision.
